AI Plagiarism Analysis

User: foowinston7523

AI Plagiarism Percentage: 0% (low)

Analysis: The text is composed of fragmented word lists, non-semantic keyboard mashing, and a standard typing pangram. This pattern is highly indicative of a human user performing casual testing or "playing" with the document rather than an AI generating structured, prompted content.

Specific Excerpts (give 2-3 examples, don't state the exact line numbers but quote the text verbatim in double quotes):

Excerpt 1: "apple bee cook"

This is a sequence of disconnected nouns and verbs lacking any grammatical or logical cohesion typical of AI-generated language.

Excerpt 2: "Vii shd ssroudhfohoaihefobgoawefoih;ihawef;ohbohaoihj;arg;ohj"

This is pure keyboard mashing, a non-semantic string of characters produced by human tactile input, which is not a pattern seen in AI-generated text.

User: notwins4056

AI Plagiarism Percentage: 0% (low)

Analysis: The content consists of repetitive character strings and a direct, first-person explanation of the user's testing intent. The explicit mention of monitoring character counts confirms the manual, human-driven nature of the input.

Specific Excerpts (give 2-3 examples, don't state the exact line numbers but quote the text verbatim in double quotes):

Excerpt 1: "Today is the 7th of May Today is the 13th of May, and I am typing this text to continue testing on my Test Versioning Google Document."

The phrasing is conversational and functional, explicitly describing human-led testing intentions and real-world activity.

Excerpt 2: "Asesedufououaedf aa
aaa
aaaaa"

The use of repeated single characters is a manual method used by humans to test character count increments and string limits.
